APPENDIX C – DEVELOPMENT OF WATER QUALITY-BASED EFFLUENT LIMITS

The calculations for water quality-based effluent limits are done according to procedures in Chapter 5 of EPA's Technical Support Document for Water Quality-Based Toxics Control (TSD).

The spreadsheets following this document contain the calculations for water quality-based limits for the Red Dog Port Site Outfalls 001 and 005.

Step 1 – Determine the Wasteload Allocations (WLAs) for each parameter

WLAs define the allowable concentration of pollutant in the effluent. The water quality criteria are converted to WLAs for the receiving water based on the following mass balance equation:

WLA = $(C_r - C_b)$ * dilution where,

 $C_{\rm r}$ Criteria that cannot be exceeded at the edge of the mixing zone

Background concentration of pollutant C_{h}

Designated mixing zone Dilution

Step 2 – Determine Long Term Averages

The acute and chronic WLAs are converted to Long Term Averages (LTA_{acute} and LTA_{chronic}) using the following equations:

 $LTA_{acute} = WLA_{acute} * e[0.5\sigma^2 - z\sigma]$ where,

 σ^2 = $ln(CV^2 + 1)$ CV = Coefficient of variation of the effluent data z = 2.326 for the 99th percentile probability basis

 $LTA_{chronic} = WLA_{chronic} * e[0.5\sigma^2-z\sigma]$ where,

 σ^2 = $ln(CV^2/4 + 1)$ CV = Coefficient of variation of the effluent data z = 2.326 for the 99th percentile probability basis

Step 3 – Determine Average Monthly and Maximum Daily Limits

To protect a waterbody from both acute and chronic effects, the more limiting of the calculated LTA_{acute} and LTA_{chronic} is used to derive the effluent limitations. The TSD recommends using the 95th percentile for the Average Monthly Limit (AML) and the 99th percentile for the Maximum Daily Limit (MDL).

To derive the MDL and the AML, the following calculations are used:

MDL = LTA *
$$e[z\sigma-0.5\sigma^2]$$
 where,

$$\sigma^2 = \ln(CV^2 + 1)$$

 σ^2 = $ln(CV^2 + 1)$ CV = Coefficient of variation of the effluent data z = 2.326 for the 99th percentile probability basis

AML = LTA *
$$e[z\sigma-0.5\sigma^2]$$
 where,

$$\sigma^2$$
 = $\ln(CV^2/n + 1)$
 CV = Coefficient of σ = Number of sar σ = 1.645 for the σ

Coefficient of variation of the effluent data CV

Number of sampling events required in permit per month

1.645 for the 95th percentile probability basis

Step 4 – Compare Aquatic Life and Technology-based Effluent Limits

Compare water quality-based (aquatic life) and technology-based effluent limits and put the more stringent limits in the permit.
